

Actions of communication and raising awareness

General actions

- Information panels will be installed on the scene by construction
- Brochures will be realized to inform about the project and its results
- News bulletins, articles in the press, reports on the television will allow to inform the inhabitants about the project and its progress
- Finally, visits and meetings with the other communities will be organized to share our experience.

The educational actions of raising awareness

To the children

It's at the start of the school year (in autumn) 2011 which will begin the school projects. They will take place in the half-days of intervention in the schools of the Community of Haute-Provence. The targeted classes will be the classes of the primary schools of the Community. Visits of the waste reception center can be organized.

The basic support of these interventions will be the movie for the children realized by the Community of Haute-Provence on the sorting of the waste

To the population

Information meetings will be organized in the various municipalities to inform the population about the project.

The support of these meetings will be the quite public movie realized by the Community of Haute-Provence on the theme of household waste.

As regards the not Collective Purification, from the first stakes in accordance with the system of the phytoépuration, open days will be organized to inform the population about this subject.

Finally, a day of animation on the theme of the environment will be organized on all the themes of the project LIFE +: household waste, energy savings, selective sorting, not collective purification.

« C.C.H.P ENVIR.
CHALLENGES »

2010-2014

LIFE, what is it?

LIFE + is a project of the European Commission to support initiatives in subjects of environment.

The Community of Haute-Provence made application form and it is among 2 French regions with a measure of autonomy retained by Europe.

CONTEXT

The Community of Haute-Provence includes 8 rural municipalities (Aubenas-les-Alpes, Dauphin, Mane, Montjustin, St Martin-les-Eaux, St Michel l' Observatoire, Villemus) and represent more than 5 000 inhabitants.

On the environmental plan, our territory is little industrialized and little urbanized. It has a quality environment the balance of which remains fragile with one intensive farming and a pollution of air and some real water.

However, even if this territory has a positive image in environmental subject because it's still protected, the air is not so pure more than in the past, the selective sorting of the waste is insufficient, a large number of houses are not linked with the collective purification.

In brief, as many rural territories of France and Europe the efforts remain to make. It's all the stake in the project " C.CH.P envir.challenges ".

Europe and the Community of Haute-Provence join around an innovative and participative action to commit the whole local population in a reflection on the management of the waste, the not collective purification and the energy savings.

Action 1 : Construction of an experimental building

It is a question of realizing an exemplary building in energy savings trying to value as much as possible the energies and the natural resources. It will be realized near the waste reception center.

This building will be equipped of:

- A wood-fired boiler
- A solar water heater
- A tank for the storage of rainwater
- A Provençal well
- Solar panels.

Objective : demonstrate that energy savings can be realized on a building of 150 m² approximately, amount to a house.

Action 2 : Reorganization of the collection of waste

The Community of Haute-Provence assures in state control the collection of domestic waste and packagings.

A service provider assures the collection of Recyclable Domestic waste (DMR), Newspapers, goes shopping and of the Glass.

The Community wishes to set up half-buried columns of a bigger capacity by grouping together 4 types of waste (household waste, packagings, glass, newspapers).

In parallel, a specific truck will be acquired.

Action 3 : Construction of a waste reception center

Two waste reception centers are present on the territory of the Community of Haute-Provence, to Dauphin and St Michel l' Observatoire (three with the integration of Reillanne in 2010)

Since the closure of the Landfill of the waste of Forcalquier in 2008, their activities strongly developed. Furthermore, these waste reception centers do not answer all the requests of the population.

It's a question of building a functional waste reception center to replace both waste reception centers of Dauphin and St Michel l' Observatoire and get back a range of waste such as:

The Waste of Electric and electronic Equipments (DEEE), the Special Household waste (DM) as paints, solvents, pesticidal the worn edible oil which will serve as second generation fuels for the vehicles of collecte.

Action 4 : Put in conformity from 30 to 40 independant purification by reed-bed

The Law on the water of January 3rd, 1992 imposes:

- To the private individuals to have a device of independant purification in compliance with the current rule
- To the municipalities to set up a Service of independant Purification to control.

The Community of Haute-Provence suggests participating in the financing from 30 to 40 installations or put in conformity which opt for the system of the phytoépuration.
